AZENTIO.AI BUILD LABS · CHALLENGE 02

Regulatory change, resolved.

Track the change. Assess policy, process and system impact. Prove it.

Clause redline | Impact graph | Audit chain

31 October 2026

Three people · six hours · one spine

THE PROBLEM

A circular is not a to-do list.

47 pages

in a typical master-direction amendment

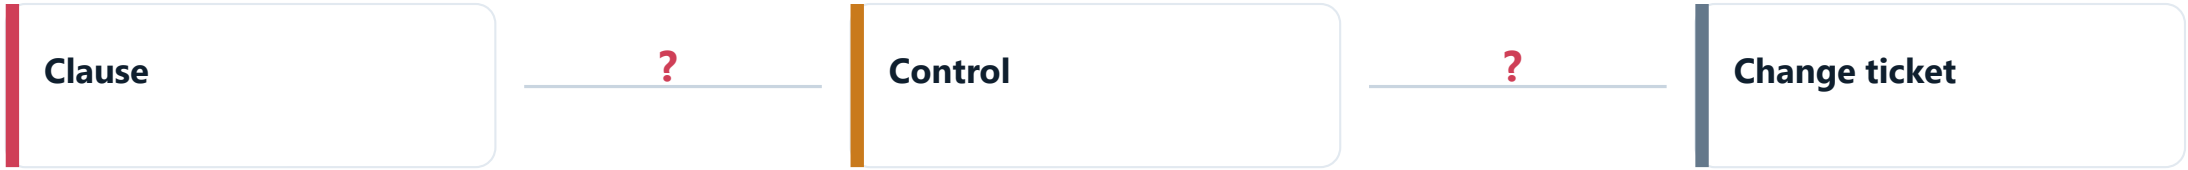

31 days

from publication to effective date

0 traceable links

between clause, control and change ticket

Compliance reads it. Operations interprets it.
Technology discovers it late. Audit asks who approved it.

The link is a person’s memory — until it isn’t.

Illustrative figures, typical master-direction amendment.

THE INSIGHT

Impact is a graph, not a summary.

A summary tells you what the regulator said.
A graph tells you what must move, who owns it, and why.

Every edge is a piece of evidence: a clause quote, a parameter, an owner, an audit event.

THE PRODUCT

One run. Five artefacts.

01

Redline

What changed, word by word

amended · added · omitted

02

Obligations

What must be done, with the quote

21 extracted · 100% evidenced

03

Impact

Which asset, what gap, how severe

101 impacts · 19 critical

04

Plan

Who does what, by when, in what order

25 tasks · 297 effort-days

05

Evidence

A hash-chained record of every decision

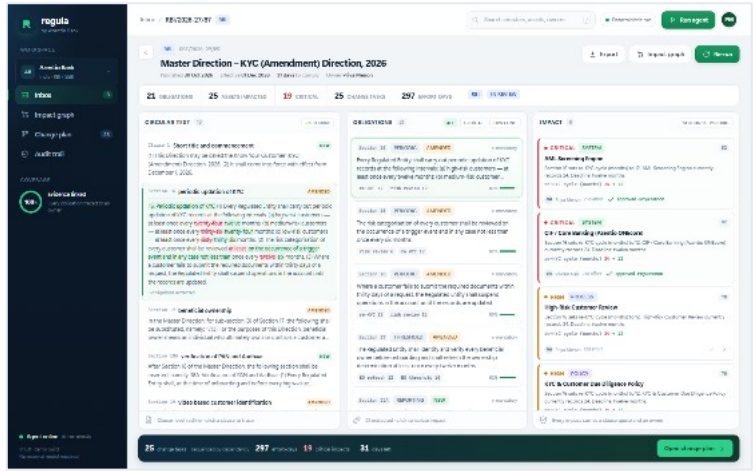

SHA-256 · append-only

Deterministic · sub-30 ms per circular · no model call required

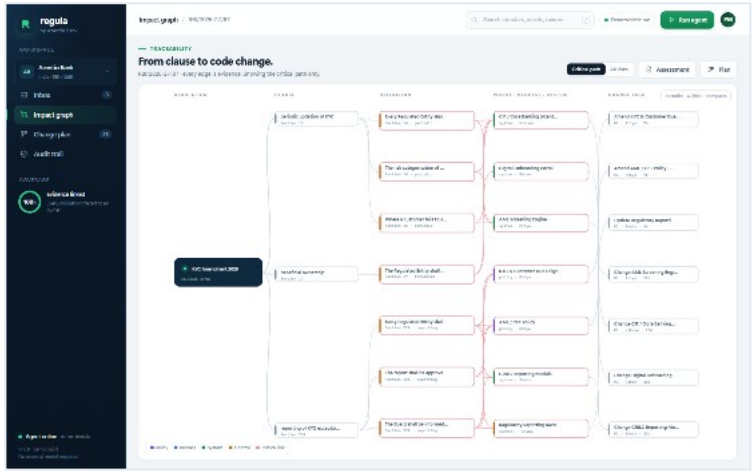

Optional LLM adapter for extraction — the audit path stays deterministic.

THE DEMO

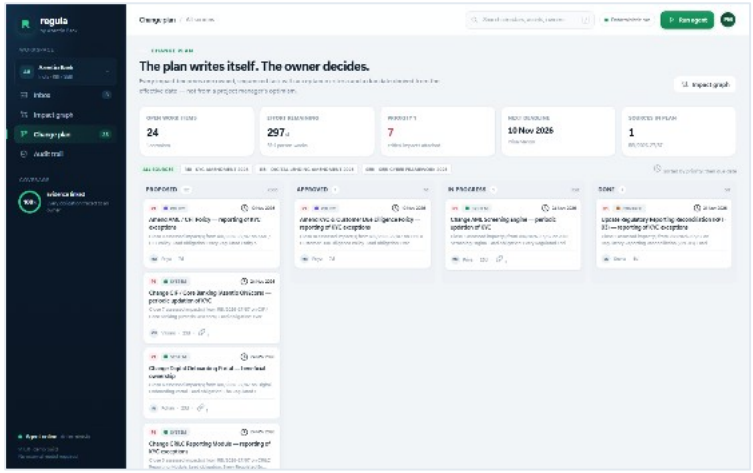

From clause to change ticket in three clicks.

→

→

01 The redline

The old 24-month cycle is struck through; 12 months is inserted.

02 The impact graph

Clause → obligation → asset → task. Every edge is evidence.

03 The plan

25 tasks, 297 effort-days, every one owned and dated.

The judge's question is not "what does it say?" It is "what do we change, and who owns it?"

Live run: 21 obligations → 101 impacts → 25 tasks · sub-30 ms

WHY IT'S TRUSTWORTHY

The agent proposes. The human approves. The chain proves.

01

Evidence-linked

Every obligation carries a verbatim quote and a clause reference. No quote, no impact.

02

Deterministic

Same document in, same assessment out. Reproducible on stage and in an audit.

03

Human-in-the-loop

Approval is an explicit act. The agent never executes a change on its own.

04

Tamper-evident

SHA-256 chain over every extraction, score, approval and status change.

"Banks don't buy magic. They buy defensibility."

ARCHITECTURE

Six extension points. One spine.

DOMAIN PACK

- **KYC / AML**
- **Digital lending**
- **Cyber resilience**

Same engine. Swap the regulatory corpus and the asset inventory; keep the evidence chain.

ZERO DEPENDENCIES

Python standard library + native ES modules.

Runs offline. No npm, no pip, no API key.

Add a regulator = one text file.
Add a control = one JSON object.

IMPACT

What changes on Monday.

<30 ms

to assess a circular

versus 2–3 weeks of manual impact analysis

100%

of obligations evidence-linked

every claim anchored to a clause

25

change tasks surfaced

297 effort-days on one circular, before the first meeting

0

untraceable approvals

every decision hash-chained

90-day pilot: one regulator · one business line · one control library.

Success = every obligation owned, every impact approved, every approval evidenced.

Prototype metrics from the demo corpus; not a production accuracy claim.

THREE PEOPLE. SIX HOURS. ONE SPINE.

Built to survive the next brief.

[Your name]	Impact engine · API · integration
[Teammate]	Frontend · product design
[Teammate]	Narrative · data · QA

THE ASK

A 90-day pilot with one compliance team and one control library.
